SYNTHETIC RUBBER :

Synthetic rubber is a belong to the family of artificially - made polymer material which acts as an elastomer and has some rubber characteristics but differs in chemical structure and properties. An elastomer can undergo much more elastic deformation under stress than most materials returning to its original size without permanent deformation.

Synthetic rubber can serve as a substitute for natural rubber in many cases, especially when improved material properties are needed. They had good resistance to weather, sun, ozone & abrasions. Their versatility makes them useful in many applications requiring oil, weather or combination of these properties such as wire & cables, molded goods, soles & heels, adhesives & alike products.
